

Control-room graphics software

Sammi 6.4 control-room graphics software allows large-scale commercial users to create and share live, data-driven displays across dozens or hundreds of workstations. This means mission-command and process-control workers can custom build and utilize synchronized, full-color dashboards to view large volumes of critical data instead of relying on numeric readings or basic, conventional GUIs. The

software creates complicated dashboards quickly for use across a network. For instance, you can design multi-layered graphics to monitor hundreds of valves at once. Sammi is sold as an application development kit and includes a format editor, runtime environment manager, and application programming interface.
